

Greetings,

For your interest in the steel erection industry, the attached PDF file contains an update of the AISC Erector Certification program. Note particularly, the release for public review and comment of a draft *Certification Standard for Steel Structure Bridge Erection*.

Updates are assembled periodically to apprise industry stakeholders of the status and progress of the AISC Erector Certification program. Please feel welcome to call or write me directly with questions you may have or with suggestions for information you would like to see included in future editions of the update.

We hope that organizations like yours will either pass the Update along to your members or use pieces of information of particular interest to your membership in your own communication or newsletter to your members.

The "big deal" in the most recent Update is the availability of the draft Erector Standard for public review and comment. To move the development process forward, I really believe we need more industry input. I am depending on organizations like yours to encourage members and industry associates to download a copy of the draft Standard and offer comments so that the task group Chip sits on has something to work with the next time we meet.

Regards,

Brian W. Miller

Director – Certification
